SPECIFICATIONS

【Real-Time Oscilloscope】

Items		
CRT		
Type		150mm rectangular CRT with internal graticule
Acceleration voltage		Approx. 12kV
Effective display area		8div×10div (1div=10mm)
Vertical axis (Common to CH1 & CH2)		
Sensitivity (+10 to +35°C)		1 or 2mV/div: ±5%, 5mV/div to 5V/div: ±3%
Attenuator		12 ranges at 1-2-5 steps, ranges fine-adjustable
Input impedance		1MΩ±2%, approx. 25pF
Frequency response (+10 to +35°C)	5mV/div to 5V/div	DC: DC to 50MHz (within -3dB) AC: 5Hz to 50MHz (within -3dB)
	1 or 2mV/div	DC: DC to 20MHz (within -3dB) AC: 5Hz to 20MHz (within -3dB)
Rise time (+10 to +35°C)	5mV/div to 5V/div	Approx. 7ns.
	1 or 2mV/div	Approx. 17.5ns
Crosstalk		-40dB or less (at 1kHz)
Operation modes	CH1	CH1 single trace
	ALT	Alternated CH1 and CH2 signal display
	CHOP	Chopped CH1 and CH2 signal display
	ADD	Added CH1 and CH2 signal display
	CH2	CH2 single trace
Chop frequency		Approx. 250kHz
Polarity reversal		CH2 only
▲ Max. input voltage		800Vp-p or 400V (DC+ACpeak at 1kHz or less)
Horizontal axis (CH2)		
Sensitivity (+10 to +35°C)		Same as vertical axis (CH2).
Input impedance		Same as vertical axis (CH2).

SPECIFICATIONS

Items		
Frequency response (+10 to +35°C)		DC: DC to 1MHz (within -3dB) AC: 5Hz to 1MHz (within -3dB)
X-Y phase difference		3° or less at 50kHz
Operation modes		X-Y mode is selectable with H.MODE switch. CH1: Y-axis, CH2: X-axis
△ Max. input voltage		Same as vertical axis (CH2).
Sweep		
Sweep method	A	A sweep
	ALT	Alternated A sweep and B sweep
	B	B sweep
	X-Y	X-Y oscilloscope operation
Sweep time	A sweep	0.5s/div to 0.1 μ s/div $\pm 3\%$, 1-2-5 steps, 21 fine-adjustable ranges
	B sweep	50ms/div to 0.1 μ s/div $\pm 3\%$, 1-2-5 steps, 18 fine-adjustable ranges
Sweep magnification (+10 to +35°C)		$\times 10 \pm 5\%$ ($\pm 8\%$ at 0.5 μ s/div or more)
Linearity (+10 to +35°C)		$\pm 3\%$ ($\times 10$: $\pm 5\%$)
Holdoff		A sweep is continuously variable from NORM position.
Trace separation		B sweep is continuously variable by ± 4 divisions or more with resp. to A sweep.
Delayed sweep		Continuous delay (AFTER DELAY) and triggered delay (B TRIG'D) triggered by trigger signal
Delay time		Continuously variable from 0.2 division to 10 divisions for 0.5s/div to 0.1 μ s/div
Delay time error (+10 to +35°C)		$\pm (3\% \text{ of set value} + 1\% \text{ of full scale}) + (0 \text{ to } 300\text{ns})$
Delay jitter		10000: 1 of 10 times as large as A sweep set value
Triggering		
Trigger modes	AUTO	Automatic free running with no signals input
	NORM	Triggered sweep
	FIX	Sweep by setting trigger point at center of signal amplitude
	SINGLE	Single sweep mode
	RESET	Single sweep is restarted.

SPECIFICATIONS

Items																																																																	
Trigger signal sources	VERT	Input signal selected with VERT MODE switch.																																																															
	CH1	CH1 input signal																																																															
	CH2	CH2 input signal																																																															
	LINE	Commercial source frequency																																																															
	EXT	Signal input to EXT. TRIG connector																																																															
The trigger source is fixed to CH1 if VERT MODE is set to ALT in the Chop and Storage mode. Or, it is fixed to CH2 if X-Y operation is selected in the Storage mode.																																																																	
Trigger coupling	AC	AC coupling from 10Hz																																																															
	HFrej	Low-pass filter coupling up to 10Hz																																																															
	DC	DC coupling

SPECIFICATIONS

Items		
Intensity modulation		
Input voltage		Darkens at TTL level (+5V).
Input impedance		Approx. 10k Ω
Frequency range (+10 to +35°C)		DC to 3.5MHz
Δ Max. input voltage		100Vp-p or 50V (DC+ACpeak at 1kHz or less)
CH1 signal output (with 50 Ω load)		
Output voltage		Approx. 50mVp-p/div
Output impedance		Approx. 50 Ω
Frequency response (+10 to +35°C)	5mV/div to 5V/div	100Hz to 50MHz (−3dB or less)
	1 or 2mV/div	100Hz to 20MHz (−3dB or less)
Trace rotation		Trace line is adjustable with semi-fixed control on panel.

【Storage Oscilloscope】 (The values enclosed in [] are those of the DCS-7020.

Vertical axis (Common to CH1 & CH2)		
Vertical resolution		8 bits (25 dots/div)
Dynamic range		±5div
Effective storage frequency		DC: DC to 16MHz [8MHz] (Sine interpolation) AC: 5Hz to 16MHz [8MHz] (Sine interpolation)
Effective rise time		40ns [80ns] or less (Linear interpolation)
Frequency response (+10 to +35°C)	5mV/div to 5V/div	DC: DC to 16MHz (−3dB or less)
		AC: 5Hz to 16MHz (−3dB or less)
	1 or 2mV/div	DC: DC to 12MHz (−3dB or less)
		AC: 5Hz to 12MHz (−3dB or less)
Memory capacity (Memory capacity used in each mode)		
NORM sampling	Display memory (for data): 2K words/channel (200 dots/div)	
	Display memory (for REF) : 2K words/channel	
	Acquisition memory : 4K words/channel	
	REF memory : 2K words/channel	

SPECIFICATIONS

Items		
Roll mode		Display memory (for data): 2K words/channel (200 dots/div)
		Display memory (for REF) : 2K words/channel
		Acquisition memory : 4K words/channel
		REF memory : 2K words/channel
Memory backup		Backed up by battery for approx. 30000 hours (at room temperature). Acquisition memory : 4K words/channel REF memory : 2K words/channel
Sweep time & display mode		
NORM sampling		0.1 μ s/div to 500s/div (Magnification range: 0.1 μ s/div to 2 μ s/div [5 μ s]) (Max. sampling speed: 40MS/s [20MS/s])
Peak detector		10 μ s [20 μ s]/div to 500 μ s/div (Sampling speed: 40MS/s)
Roll mode		0.2s/div to 500s/div
Storage method		
AUTO		Same as NORM when triggered. Data is updated by free running in other condition.
NORM		Data is updated every time acceptable trigger signal is input.
SINGLE		Storage operation is carried out when first acceptable trigger signal is input after resetting, then data is saved.
PEAK	MAX	Positive voltage glitches of up to 25ns [50ns] wide are detected.
	MIN	Negative voltage glitches of up to 25ns [50ns] wide are detected.
	MAX/MIN	Positive and negative voltage glitches of up to 50ns [100ns] wide are detected (and displayed alternately).
AVE (Averaging)		Arithmetic average of 4, 16 and 64 times
SMT (Smoothing)		Moving average of 32 words
PST (Persistence)		Maximum and minimum values are displayed alternately in Storage mode. Reset by selecting PST. RESET.
ROLL	NORM	Data is displayed and updated continuously on CRT.
	SINGLE	Data is updated at pre-trigger set value after acceptable trigger signal is input. Then, data is saved.

SPECIFICATIONS

Items		
Magnification		
Magnification		Data is magnified up to $\times 10$ from CRT center by linear interpolation when $\times 10\text{MAC}$ is pressed in Hold state.
Interpolation		Previous value interpolation in magnification range (interpolation: OFF), linear interpolation and sine interpolation
Triggering		
Pre-triggering	NORM	0 to 20 divisions (in 2.5div steps)
	ROLL-SINGLE	10 to 20 divisions (in 2.5 div steps)
B triggering	AFT. DLY	B starts after delay time.
	B TRIG'D	B TRIG'D after delay time.
X-Y		DC to 16MHz [8MHz] (-3dB or less, sampling speed is variable with SWEEP TIME/DIV.)
External clock(Also used as external trigger terminal.)		
Operation		Data is sampled at leading edge of signals input to external clock connector when SWEEP TIME/DIV is set to EXT.
Input impedance		$1\text{M}\Omega \pm 2\%$, approx. 25pF
Δ Max. input voltage		100Vp-p or 50V (DC+ACpeak at 1kHz or less)
Input signal level		TTL level L level: +0.4V or less H level: more than +3.2V
Input signal frequency range		DC to 1MHz(1 kHz max. at roll mode)
Input signal duty ratio		20 to 80% (L level: +0.4V, H level: +3.2V)
Output		
		Optional IF-10 or IF-20 may be connected. (Both cannot be connected together.)
IF-10	GP-IB interface (Conforms to IEEE-488 1978.)	
	Operation	Waveform displayed on CRT and CRT readout data are output to plotter through GP-IB interface (using TALK ONLY and HP-GL commands). Numeric data of waveform displayed on CRT and CRT readout data are output to computer through GP-IB interface.

SPECIFICATIONS

Items	
IF-20	EIA RS-232C interface
	Operation Waveform displayed on CRT and CRT readout data are output to plotter through RS-232C interface (using HP-GL commands). Numeric data of waveform displayed on CRT and CRT readout data are output to computer through RS-232C interface. Waveform displayed on CRT and CRT readout data are output to printer (DPU-412 made by SEIKO) through RS-232C interface.
	Baud rate 9600/1200bps
	Data transmission Data length: 8bits, stop bit: 1bit or more, parity bit : none, delimiter: CR+LF, handshake: CTS-RTS method

【Readout Section】

Items	
Display	Turned on and off by keeping CURSOR MODE switch depressed for 1 second or so.
Calendar	
Display	M/D/Y/H/M which is turned on and off by keeping TIME ON/OFF switch depressed for 1 second or so.
Clock accuracy	±2 minutes/month
Battery life	Approx. 30000 hours (at room temp.)
Clock correction & setting	Set on Storage menu.
Set values	
Vertical axis	CH1 & CH2 scale factors (with probe detection), V-UNCAL, ADD & INV
Horizontal axis	A/B sweep scale factors (magnification conversion), ×10MAG, X-Y, external clock, & SWEEP VARIABLE UNCAL
Triggering	Delay time, B TRIG'D
Storage	X-Y sampling speed, display scroll & setting storage function (peak types, average and number of times, SMT, PST, ROLL & interpolation types), pre-triggering point, REF memory setting condition, menu, & output

SPECIFICATIONS

Items		
Cursor measurement		
Cursor mode		Measurement between Δ REF and Δ cursors. Only Δ V1 may be set in X-Y mode.
	Δ V1	Voltage converted using CH1 scale factor is displayed.
	Δ V2	Voltage converted using CH2 scale factor is displayed.
	Δ T	Time converted using A sweep scale factor is displayed.
	$1/\Delta$ T	Frequency converted using A sweep scale factor is displayed.
When V or H. VARI are UNCAL condition	RATIO	Voltage ratio and time ratio are displayed based on 5 divisions on CRT as 100%.
	PHASE	Phase difference is displayed based on 5 divisions as 360° .
Cursor measurement	Resolution	10bits
	Measurement error	$\pm 4\%$
	Measurement range	± 3.6 divisions or more from CRT center vertically ± 4.6 divisions or more from CRT center horizontally
Display offset		Vertical or horizontal shift between waveform displayed on CRT and waveform output from oscilloscope is corrected.

【Power Supply】

Items		
Power supply		
Supply voltage		100/120/220/230VAC $\pm 10\%$
Frequency		50 or 60Hz
Power consumption (on 100VAC)		Approx. 57W, 69VA (when optional IF-10 GP-IB interface is used)
Withstand voltage		1.5kVAC, 1 minute or more
Insulation resistance		100M Ω or more at 500VDC

SPECIFICATIONS

【Other Specifications】

Items	
Dimensions & weight (Values enclosed in parentheses include projections.)	
Width	305mm (344mm)
Height	150mm (165mm)
Depth	400mm (459mm)
Weight	Approx. 9.6kg
Operating temperature & humidity	
Operating	0 to +40°C, 85% or less (No dew condensation)
Storage	-20 to +70°C, 85% or less (No dew condensation)
Accessories	
Probe	PC-33, two
	Attenuation 1/10
	Input impedance $10M\Omega \pm 1\%$, $22pF \pm 10\%$
Instruction manual	1 copy
Adjusting screwdriver	1
Power cord	1
Replacement fuse	1

SAFETY

SAFETY

Before connecting the instrument to a power source, carefully read the following information, then verify that the proper power cord is used and the proper line fuse is installed for power source. The specified voltage is shown at the fuse holder of the AC inlet. If the power cord is not applied for specified voltage, there is always a certain amount of danger from electric shock.

Line voltage

This instrument operates using ac-power input voltages that 100/120/220/230 V at frequencies from 50 Hz to 60 Hz.

Power cord

The ground wire of the 3-wire ac power plug places the chassis and housing of the oscilloscope at earth ground. Do not attempt to defeat the ground wire connection or float the oscilloscope; to do so may pose a great safety hazard. The appropriate power cord is supplied by an option that is specified when the instrument is ordered.

The optional power cords are shown as follows in Fig. 1.

Line fuse

The fuse holder is located on the rear panel and contains the line fuse. Verify that the proper fuse is installed by replacing the line fuse.

Voltage conversion

This oscilloscope may be operated from either a 100 V to 230 V, 50/60 Hz power source. Use the following procedure to change from 100 to 230 volt operation or vice versa.

1. Remove the fuse holder.
2. Replace fuse F 1 with a fuse of appropriate value, 1 amp for 100 VAC to 120 VAC operation. 400 m amp for 220 VAC to 230 VAC operation.
3. Reinsert it for appropriate voltage range.
4. When performing the reinsertion of fuse holder for the voltage conversion, the appropriate power cord should be used. (See Fig.1.)

Plug configuration	Power cord and plug type	Factory installed instrument fuse	Line cord plug fuse	Parts No. for power cord
	North American 120 volt/60 Hz Rated 15 amp (12 amp max; NEC)	1 A, 250 V Slow blow 5 × 20 mm	None	E30-1951-05
	Universal Europe 220 volt/50 Hz Rated 16 amp	North Europe 400 mA, 250 V Slow blow 5 × 20 mm	None	E30-1952-05
	U.K. 240 volt/50 Hz Rated 5 amp	400 mA, 250 V Slow blow 5 × 20 mm	5 A	E30-1963-05
	Australian 240 volt/50 Hz Rated 10 amp	400 mA, 250 V Slow blow 5 × 20 mm	None	E30-1953-05
	North American 240 volt/60 Hz Rated 15 amp (12 amp max; NEC)	400 mA, 250 V Slow blow 5 × 20 mm	None	—
	Switzerland 240 volt/50 Hz Rated 10 amp	400 mA, 250 V Slow blow 5 × 20 mm	None	—

Fig. 1 Power Input Voltage Configuration

CIRCUIT DESCRIPTION

PREAMPLIFIER UNIT

CH1, CH2

Each of the CH1 and CH2 inputs passes through an AC/DC/GND switch and enters the 1st attenuator (1/1, 1/10, 1/100).

The 1st attenuator is used in combination with the 2nd attenuator (1/1, 1/2, 1/4, 1/10) and the 5-fold function of the 2nd amplifier, to switch the 12 vertical ranges.

The head amp is composed of Q102 and IC101 (Q202 and IC201) and is a 1/1 buffer amp with an input impedance of 1 megohms and used for conversion of impedance. Q102 (Q202) is the source-follower. This head amp is installed between the 1st and 2nd attenuators.

Starting from the 2nd amp, this unit takes the differential amplifier configuration. The functions of IC102 (IC 202) include the variation and inversion functions. The variation function allows to vary the gain continuously according to the voltage applied to pin 5. The inversion function allows to invert the phase according to the voltages applied to pins 6 and 7. As this function is provided only for CH2, CH1 is fixed. At the CH2 side, switch is done by Q215, Q103 (Q203) is the regulated current supply for IC102 (IC202).

Q106 and Q107 (Q206 to Q207) form an emitter follower.

Q108 to Q111 (Q208 to Q211) form the cascode amp of the differential amp. The vertical position can be moved by regulating the current applied to the emitter of Q111 (Q211) based on the panel operation.

Q501 and Q502 (Q601 and Q602) form the amplifier which obtains the signals for the DSP unit and sends them to the DSP unit differentially.

EXT. TRIG, EXT. CLOCK

A fixed attenuator is used for the EXT. TRIG signal. After the impedance has been converted by the source-follower of Q303 and the buffer amp of regulated current supply Q304, the signal is sent to the emitter-follower of Q314. Q315 is the feedback amp for the EXT. CLOCK signal, which is inverted by IC4a and sent to the DSP unit.

Channel selector

The output from the position amp of each channel is transmitted to the channels elector composed of Q110 and Q111 (Q210 and Q211) and D103 to D106 (D203 to D206). The signal from the V-MODE logic turns the cathodes of D104 and D105 (CH1) or D204 and D205 (CH2) "H", and the signal of the channel turned "H" is transmitted to the feedback amp composed of Q2 and Q3.

Q1 lets the excessive bias current flow when CH1 or CH2 is in ADD mode.

Trigger amp, trigger selector

With CH1 (CH2), the differential outputs from IC102 (IC202) are input to the differential amp Q152 and Q153 (Q252 and Q253), where Q153 (Q253) forms a cascode amp with Q114 (Q214).

With EXT. TRIG the signal after the buffer amp is sent through

the buffer of emitter-follower Q314, feedback amp Q312 an output as current from the collector of emitter ground amp Q313.

Only the single of the channel with which the cathode of CH1-D108, CH2-D208, EXT-D308 is turned "H" by the signal from the trigger controller is sent through CH1-D107, CH2-D207, EXT-D307 and output as current to the Horizontal unit. Q31 the excessive bias current flow when CH1 or CH2 is in ADD mode.

CH1 OUT

The CH1 output is sent from the collector of Q152, through emitter-follower Q51 and output at CH1 OUT of the Final unit.

Trigger controller

The data on the trigger source set on the panel is input to pin 1 of IC1 and "H" or "L" is output at pins 4 to 8 according to the set state.

IC2 is used to switch between the data from IC1 and the CRT display data of each channel from V-MODE LOGIC. If the current mode is not V mode, the former data is selected. If the current mode is V mode, the latter data is selected for use in controlling the trigger selector.

Among CH1-IC2 pin 7, CH2-IC2 pin 9, CH3-IC2 pin 12, the terminal set with the panel is turned "H".

V-MODE LOGIC

IC3 and IC4 generates a signal synchronized with the display channel select signal from the panel and the end of horizontal sweep, and a signal for controlling the channel selector based on the CHOP signal. (Figure 1)

Vertical range converter

IC401, IC403, S102 and S202 output the vertical range, CAL and UNCAL data by turning them into analog values using an opamp for use as the R/O data. (Tables 1, 2)

H/V control, level converter

The sweep code is sent in the form of serial data to IC408 and IC409, converted from serial to parallel, and converted into a signal between 0 and -12 V by IC404, IC405, IC406 and IC407.

IC410 outputs the CH1/CH2/ADD select signal and the Horizontal unit control signal. For the serial codes, refer to Tables 3 and 4.

FINAL UNIT

Final amplifier

The signal sent from the vertical preamp through the delay line is input to the feedback amp of Q1 and Q2. During A ALT B sweep, the variation of the vertical position of sweep B is controlled by the signal to the base of Q2 from the Sweep unit.

Q3, Q4, Q105, Q106 and IC1 are used to amplify the vertical signal and IC1, Q105 and Q106 are used to amplify the R/O

CIRCUIT DESCRIPTION

characters. IC1 is used to switch between the vertical signal and R/O signal.
Q9-Q12, Q113 and Q114 are cascode-connected for use in driving the CRT.

AC inlet, fuse

An external commercial supply voltage switch and fuse holder are provided.

Line filter

A filter for elimination of common mode noise and normal mode noise is provided.

CH1 OUT

The signal from the vertical preamp is output externally via Q201 and Q202 as a signal with 50-ohm impedance.

SWEEP UNIT

Trigger

The trigger signal supplied from the Preamplifier unit (X73-2120) is AC/DC coupled and the trigger level is added to it.

The obtained signal is input to the trigger shaping circuit to become a pulse signal.

If FIX is selected, the trigger level is fixed so that it is always around the center of the waveform.

With TV-FRAME the composite video signal is separated by the V sync separator and input to the trigger shaping circuit.

With TV-FRAME the composite video signal is separated by the H sync separator and input to the trigger shaping circuit.

HFree is used to apply a 10 kHz LPF to the trigger signal.

The polarity of the trigger pulse signal can be changed with SLOPE +/- . The output signal is input to the sweep logic circuit.

There is an additional circuit which applies the trigger signal to the sweep logic in case the trigger pulse signal has not been input for a certain period and auto free-run mode has been selected.

Sweep

When the trigger pulse is input to the sweep logic, the sweep gate is activated and the sweep wave is output.

When the sweep wave reaches a certain level, the sweep stop circuit is activated to close the sweep gate and end sweep.

When sweep gate is closed, the hold-off circuit is activated and, in a certain period after it, the sweep logic enters the trigger standby state.

The delayed sweep is performed either as the AFTER DELAY sweep or B TRIG'D sweep.

With the AFTER DELAY sweep, the voltage level of the main sweep wave and the voltage set with DTP are compared and delayed sweep is performed using the result signal as the trigger.

With the B TRIG'D sweep, sweep is triggered by the next trigger signal input after the voltage level of sweep wave have reached the voltage set with DTP.

In case ALT sweep is set, the main sweep and delayed sweep are sent alternately to the Horizontal amp.

Horizontal amp

This circuitry switches between the sweep wave generated in the sweep block and the X signal and add H-POSITION.

After being magnified by 10 times if MAG has been selected, the signal is input to the R/O switch.

Here, the R/O signal is added to the vertical signal and the signal is amplified by the final amp to a high enough voltage level to drive the CRT.

Intensity circuit

The intensity signal is generated with the sweep gate of the main sweep and that of the delayed sweep. During ALT sweep, a waveform for increasing the intensity of the delayed sweep section is generated with the main sweep. The voltage set with the INTEN potentiometer is added to the intensity signal and the voltage set with the R/O INTEN potentiometer is added to the R/O blanking signal and they are input to the high voltage circuit.

The high voltage circuit generates the CRT cathode voltage, G1 voltage and P1 voltage based on the intensity signal and the FOCUS potentiometer.

The cathode voltage is controlled always constant by the opamp. For use with the after-accelerating CRT, the anode voltage is also generated by the high voltage circuit.

Power supply

AC voltages for stable DC voltage of 7.7V, 15.5V, 69V and 173V are input from the transformer, and they are turned into stable DC voltages of respectively +12, -12V, +5V, +55V and +140V, which are supplied to their respective units.

CHOP

To observe signals of two each channels simultaneously, the vertical amp is switched with the CHOP signal.

The switching frequency rate is about 250 kHz.

PANEL UNIT

This unit sends the potentiometer and switch data from the control panel to other units.

The circuitry has been designed so that, even when the V MODE is selected as the TRIG SOURCE during the ALT setting in the CHOP or STO mode, CH1 is selected as the TRIG SOURCE automatically.

The voltage setting of DTP is made by the opamp in the range from 0 to +4 V. The DISPLAY OFFSET control is a potentiometer for use in fine adjustment of the vertical position of the R/O characters and STO waveform displayed on the CRT. The CAL signal is a 1 kHz, 1 Vp-p square wave.

The intensity is controlled by the PWM based on the output from the original oscillator of CAL.

CIRCUIT DESCRIPTION

DSP UNIT

The DSP unit (X79-1300-0*) is used in the A/D conversion, control of the preamp and sweep units, output of characters to the CRT and output of stored waveforms to the CRT.

The waveform signals from the vertical unit are converted from analog to digital by IC100 (CH1) and IC200 (CH2). Each of the A/D converters (IC100, IC200) executes A/D conversion at the positive-going edge of the CLK signal input at pin 2. The output data is input to IC102 (CH1) or IC202 (CH2) and latched inside the IC for peak detection and write in the 2-phase memory, and the latched data is written in the memory of IC103 and IC104 (CH1) or IC203 and IC204 (CH2). Fig. 2 shows the interior of gate array IC102 or IC202 and its connection with the memory. Fig. 3 shows the timings of ILA1 and ILA4 of IC102 and IC202, and data is recorded in IC104 (IC204) then IC103 (IC203).

The memory devices used in the DSP unit are the serial access memory with separate input/output configuration and with built-in address generating counters. The built-in counter is reset when ADRV goes "L" or when WRES is generated with the timing shown in Fig. 4. Data is written in memory when pin 12 (WE) of IC103, IC104, IC203 or IC204 is "L", at the timing of the negative going of pin 15. The recorded data is output at the negative going of pin 2 (RCLK) of IC103, IC104, IC203 or IC204. The signals read out from the 2-phase memory are input to IC102 and IC202, and 2 words of signal is transferred simultaneously to the 16-bit data bus of ADD0 to ADD15.

The operation clock of these ICs is variable between 40 MHz and 0.4 Hz (20 MHz and 0.4 Hz) according to the sweep time. The output from the 80 MHz oscillator composed of X1, Q301 and Q302 is divided by the counter of IC42 into 40 MHz, 20 MHz and 10 MHz, which are input to the multiplexer of IC38. The 40 MHz clock is input to pin 6 of IC41 and divided with the division ratio which is set with the serial data sent according to the sweep time. The signal output from pin 12 of IC41 is divided into two by IC37a and input to pin 1 of IC38 and pin 15 of IC41, and a signal between 0.4 Hz and 4 kHz is output according to the sweep range. Among the 40 MHz, 20 MHz, 10 MHz, between 10 kHz and 4 MHz and between 0.4 Hz and 4 kHz and EXTCLK signals input to IC38, one signal is selected according to the sweep code sent to IC38 and output from pin 5 of IC38. The output signal is input to the multiplexer of IC40 and the gate array of IC102 and IC202. The clock selected with IC40 is used as the operation clock for A/D converters IC100 and IC200 and the timebase PLD of IC45.

The main operations performed inside the timebase PLD of IC45 are the latch control, memory control and pretrigger control operations.

For the data write operation, LATCK is input to pin 61 and latch clocks CH1L1, CH1L4, CH2L1 and CH2L4 for the gate array and clocks WCLK, WRES and ADRV for the memory are generated based on it. The number of write data which is determined by the set pretrigger value is counted using SGA

(SGB) input to pin 58 (pin 57). The CPU is informed of the completion of data write with the interrupt applied when ADRV goes "L". The PLD includes a counter which is synchronized with the counters built in the memory and, when 4K words of data has been written, it outputs address data (YBUS0 to YBUS7) upon request from the CPU.

The data read operation is performed based on the timing shown in Fig. 5. The read data is sent through the line driver of C28 and IC30 and written in the memory of IC24 and IC25.

IC13, IC14, IC16 and IC47 are decoders which output the serial data for use in the horizontal timebase PLD, divider circuit and gate array control and the signal for use in the port control.

The position of the readout cursor and the DTP are converted into 12-bit serial data by A/D converter IC2 and the data is transmitted to the CPU.

IC10 and IC15 transfers data to the data bus when pin 9 of IC47 in the import section goes "L".

The transferred data includes the panel information (SINGLE, READY*, 10MAG, encoder), timebase PLD information and the battery detection result.

The rotary encoders used as the menu select knob and switch time switching knob have two outputs (phase A, phase B). The timings of phases A and B are as shown in Fig. 6. The outputs of phases A and B are input to the Schmitt circuit of IC11 and IC12 to eliminate chattering and shape the waveforms. When phase A varies, pin 8 of IC11 outputs a trigger pulse to inform the CPU of the change in the rotary encoder by turning pin 8 of IC9 "L". The CPU judges the rotation direction from the variations in phases A and B at the moment it is interrupted.

IC16 is a calendar clock which is battery-backed up by lithium battery BA1 even when the power is OFF. The 32.768 reference clock generated by X'tal oscillator X3 is also running while the power is OFF. When power is ON, the CPU reads data at a constant interval and updates the calendar on the SRT whenever there is a change in the data.

The battery power is detected with IC36a. When the battery voltage drops below 2.4 V, it sets pin 17 of IC15 "H" to inform the CPU of it and displays "BATT. DOWN" on the CRT. IC32 is the D/A converter which converts the trace position data of B sweep into analog voltage.

The display clock has been designed to implement the readout display function. It is composed of VRAM IC19, the VRAM address buss switch for IC20, IC21, IC22 and IC23, R/D PLD IC17, D/A converters IC33 and IC34 and opamp IC 35. For the vertical range input operation, the analog voltages (CH1ATT, CH2ATT) set according to the ranges are input directly to the CPU. As the CPU incorporates A/D converters, it judge the range settings by converting the input voltages from analog to digital.

The R/O PLD contains the latch for operation mode selection, display blanking generator, VRAM address counter, VRAM data bus switch, latch for X-Y data readout and latch for Y-axis

CIRCUIT DESCRIPTION

D/A data expansion (for use with the cursor), and generates the signal for use in R/O display.

The X data output from the R/O PLD is sent to IC33 and the Y data is sent to IC34. The analog signals obtained by conversion in IC33 and IC34 are input in the horizontal and vertical final amps.

In the storage mode, every dot of waveform is output in $1\ \mu\text{s}$ so the waveform display period is about 8 ms with 4 waveforms (CH1, CH2, REF1, REF2) each of which uses 2K words of data. As every dot of character is displayed in $2\ \mu\text{s}$, the character display period is about 6 ms and the period required for updating the CRT display in the storage mode becomes about 20 ms which is equal to the total of the waveform display, character and data transfer periods.

In the realtime mode, every character dot is output in $5.3\ \mu\text{s}$ so the character display period is about 16 ms while the data transfer period is about 5 ms. As a result, the period of display for a screen becomes about 21 ms.

Fig. 7 shows the timings of R/O UBL, R/O REQ and R/O BLK used for displaying characters. R/O UBL is output so that the dots light for $0.75\ \mu\text{s}$. R/O REQ in the realtime mode is output for $1.25\ \mu\text{s}$ providing margins of $0.25\ \mu\text{s}$ before and after R/O UBL. This signal is fixed at "L" in the storage mode. R/O BLK in the realtime mode is output for $2\ \mu\text{s}$ to clear the waveforms, providing margins of $0.75\ \mu\text{s}$ before and $0.5\ \mu\text{s}$ after R/O UBL. In the storage mode, only the waveforms of the channel(s) which require(s) waveform display are lit.

ADJUSTMENT

To obtain the best performance, periodically calibrate the unit. Sometimes, only one mode need be calibrated, while at other times, all modes should be calibrated. When one mode is calibrated, it must be noted that the other modes may be affected. When calibrating all modes, perform the calibration in the specified sequence.

The following calibration required an accurate measuring instrument and an insulated adjusting flat blade screwdriver. If they are not available , contact your dealer. For optimum adjustment, turn the power on and warm up the scope sufficiently (more than 30 minutes) before starting. Before calibrating the scope, check the power supply voltage.

TEST EQUIPMENT REQUIRED

The following instrument or their equivalent should be used for making adjustment .

Test Equipment	Model	Minimum Specification
Digital Multi-Meter	DL-7 12 (KENWOOD)	Impedance: More than 10 MΩ, Measuring range: 0.2 V to 1000 V
Sine-Wave Generator	651 B (YHP)	Frequency: 10 Hz to 10 MHz, constant voltage over tuning range
Sine-Wave Generator	SG-503 (Tektronix)	Frequency: 50 kHz to 100 MHz, Output impedance: 50 Ω, constant voltage over tuning range
Square-Wave Generator	PG-506 (Tektronix)	Output signal: 1 kHz, Amplitude: 10 mVp-p to 10 Vp-p, Accuracy: within ± 1%, Rise time: 35ns or less 100 kHz, Rise time: 1 ns or less
Q Meter	4343B (YHP)	—
Color Pattern Generator	CG-921 (KENWOOD)	—
Oscilloscope	CS-6040 (KENWOOD)	Sensitivity: more than 1 mV Frequency response: More than 150 MHz
Time-Marker Generator	TG-501 (Tektronix)	Time mark: 0.5 s to 0.1μs repetitive waveform
High-Voltage Probe	—	Input Impedance: 1000 MΩ
Termination	—	Impedance: 50 Ω Accuracy: within 3%
Termination	—	3 watts type impedance: 50 Ω
Attenuator	—	— 20 dB attenuation (50 Ω)

Table 1

PREPARATION FOR ADJUSTMENT

Control Settings

The control settings listed below must be used for each adjustment procedure. Exceptions to these settings will be noted as they occur. After completing a adjustment, return the controls to the following settings.

NAME OF KNOBS	POSITION
INTEN	12 o'clock
FOCUS	Optimum position
CH1, CH2, POSITION	Mechanical center
POSITION	Mechanical center
× 10 MAG	OFF
VARIABLE, H.VARIABLE	CAL
(VOLTS/DIV, SWEEP TIME/DIV)	
AC-GND-DC (CH1 and CH2)	AC (GND at no signal)
VERTICAL MODE	CH1
HORIZONTAL MODE	A
TRIGGERING COUPLING	AC
TRIGGERING SOURCE	VERT MODE
TRIGGERING MODE	AUTO
TRIGGERING LEVEL	Mechanical center
VOLTS/DIV (CH1 and CH2)	5 V/DIV
A/B SWEEP TIME/DIV	0.5 s/50 ms
CH2 1 NV	OFF
HOLD OFF	Fully CCW
SLOPE	■ +

Table 2

ADJUSTMENT

Item	Adjustment	P. C. B.	Procedure
Operating voltage	VR4 VR303	X80-1370 X74-1590	V.MODE : CH1 H.MODE : X-Y AC-DC : GND R/O : OFF VOLTS : 10 mV 1) With each POSI, place the spot on the CRT center. 2) Adjust VR4 so that the voltage across P105-1 or 3 on X80-1370 and GND is 33.5 [V]. 3) Adjust VR303 so that the voltage across CN7-1 on X74-1590 and GND is 70 [V]. 4) Check that the voltage across CN7-4 on X74-1590 and GND is about 70 [V].
Focus Center and ASTIG	VR201 VR305	X74-1590	V.MODE : CH1 VOLTS : 10 mV AC-DC : GND H.MODE : X-Y 1) Move the spot to the CRT center by operating the POSI controls. 2) Adjust the spot to the best point with FOCUS on the panel and ASTIG (VR305). 3) Set FOCUS on the panel to the 12:00 position and adjust VR201 to move the spot to the best point.
Intensity	VR202	X74-1590	V.MODE : CH1 VOLTS : 10 mV AC-DC : GND H.MODE : X-Y 1) Set INTEN to the 10:00 position. 2) Adjust VR202 so that the spot disappears at the 10:00 position.
Cusor Y-Gain and POSI	VR3(Gain) VR2(POSI)	X80-1370	V.MODE : CH1 H.MODE : A AC-DC : GND R/O : ON (ΔT) VOLTS : 10 mV A.SWEEP : 1 ms 1) Ensure that the R/O display to 80 mV when turn the ΔREF knob fully counterclockwise and Δknob fully clockwise. 2) Adjust VR3 and VR2 so that the interval between cusor is 8 div. 3) Adjust VR2 to make it uniform.
Cursor X-Gain and POSI	VR304 (Gain) VR306 (POSI)	X74-1590	V.MODE : CH1 H.MODE : A AC-DC : GND R/O : ON (ΔT) VOLTS : 10 mV A.SWEEP : 1 ms 1) Ensure that the R/O display to 10.0 ms when turn the ΔREF knob fully counterclockwise and Δknob fully clockwise. 2) Adjust VR304 and VR306 so that the interval between cursor is 10 div. 3) Adjust VR306 to make it uniform.
CH1 Gain	VR1 (10 mV) VR102 (1 mV)	X80-1370 X73-2120	V.MODE : CH1 VARI : CAL AC-DC : DC H.MODE : A VOLTS : 10 mV 1) Input a 50 mV square wave signal. 2) Adjust VR1 so that the amplitude is 5 div. (10 mV range) 3) Switch VOLTS to 1 mV and input a 5 mV square wave signal. 4) Adjust VR102 so that the amplitude is 5 div. (1 mV range)
CH2 Gain	VR207 (10 mV) VR202 (1 mV)	X73-2120	V.MODE : CH2 VARI : CAL AC-DC : DC H.MODE : A VOLTS : 10mV 1) Input a 50 mV square wave signal. 2) Adjust VR207 so that the amplitude is 5 div. (10 mV range) 3) Switch VOLTS to 1 mV and input a 5 mV square wave signal. 4) Adjust VR202 so that the amplitude is 5 div. (1 mV range)

ADJUSTMENT

Item	Adjustment	P. C. B.	Procedure
X-Gain	VR308	X74-1590	<p>V. MODE : CH2 VARI : CAL AC-DC : DC H. MODE : X-Y VOLTS : 10 mV</p> <p>1) Input a 50 mV square wave signal to CH2. 2) Adjust so that the amplitude is 5 div. (10 mV range) * Make the adjustment to 5 div., at the CRT center.</p> 
CH1 Step ATT Balance	VR103	X73-2120	<p>V. MODE : CH1 VOLTS : 5 mV AC-DC : GND H. MODE : A</p> <p>Adjust so that the luminescent line does not move when VOLTS is switched from 5 mV to 2 mV. * Adjust after switching to 2 mV with reference to the 5 mV position.</p>

TROUBLESHOOTING

When operating the DCS-7020/7040, be sure to use the proper procedure and check all panel settings. A wrong setting cause abnormal operation from even a good product. For example, observation of a waveform with high noise components is accompanied by jitter. In such a case, the jitter can be corrected by setting the trigger coupling to HFrej. If there is any function which you do not understand, check out by reading the instruction manual. If the operation is abnormal even when the operating procedure is correct, remove the top case and bottom panel.

CAUTION

HIGH VOLTAGE PARTS ARE INSIDE THE EQUIPMENT. THEY ARE EXTREMELY DANGEROUS.

Check all PC boards to ensure that there is no unplugged connector or soldering defect. Some problems may be corrected by applying correct adjustment. For example, if the trace moves up and down when the Vertical Variable control is turned, it can be corrected by adjusting the Variable balance. For the adjustment methods, read the descriptions of adjustment procedures. The description in the troubleshooting section use the same circuit names as those used in the block diagram. Refer to the block diagram when reading the troubleshooting.

First, start with checking the power supply block. Check the voltages at IC401 on X74-1590.

pin no.	voltage
1	+140
4	+55
6	+12
8	-12
10	+5
11	-8

OK (Acceptable): Go to next step.
NG (Unacceptable): There is a problem in the power supply block. Check the regulator circuit

a: In case no spot is displayed on the CRT in the X-Y mode.
Check that voltages at pins 1 and 4 of CN7 on the X74-1590.

OK: Check the voltages at pins 1 and 3 of CN5 on the X80-1370.

NG: There is a problem in the vertical amp. (Go to i.)
NG: There is a problem in the horizontal amp. (Go to c.)

b: Check if the voltage at W18 on X74-1590 is correct.
OK: There is a problem in the BLK amp.
NG: There is a problem in the HIGH Volts converter.

c: Short-circuit the bases of Q306 and Q307 on X74-1590.

A spot is displayed on the CRT:
There is a problem somewhere before the X amp. (Go to d.)

Nothing is displayed on the CRT:
Short the collectors of Q310 and Q311.

A spot is displayed on the CRT:
There is a problem in the MAG amp or R/O SW.

Nothing is displayed on the CRT:
There is a problem in H-FINAL.

d: Short-circuit the collector of Q151 on X74-1590 with the chassis.

A spot is displayed on the CRT:
There is a problem in the Vertical block.

Nothing is displayed on the CRT:
There is a problem in the X amp.

e: In case no trace is displayed on the CRT in the A sweep mode.

Measure the waveform at pin 12 of IC102 on X74-1590.
OK: Measure every waveform after IC102 to locate the defective position.

NG: Measure the A SWEEP GATE, A SWEEP, A SWEEP STOP and HOLD OFF waveforms to locate the defective position.

f: In case no trace is displayed on the CRT in the B sweep mode.

Measure the waveform at pin 12 of IC105 on X74-1590.
OK: Measure every waveform after U105 to locate the defective position.

NG: Measure the B SWEEP GATE, B SWEEP, B SWEEP STOP and DTP circuit waveforms to locate the defective position.

g: Intensity is not modulated in ALT sweep mode.

Check the waveform at the collector of Q116 on X74-1590.

OK: There is a problem in INTEN.
NG: There is a problem in the BLK amp.

h: Triggering cannot be applied.

Check the waveform at the collector of Q151 on the X74-1590.

OK: Check the waveform at the collector of Q158 on X74-1590.

OK: There is a problem in the Schmitt circuit.
NG: There is a problem in the Trig. Coup.

NG: There is a problem in the trigger selector.

i: Trace is not displayed.

Short-circuit the bases of Q107 and Q108 on X80-1370 and check if a trace is displayed on or near the center.

OK: Short-circuit the bases of Q1 and Q2 on X80-1370 and check if a trace is displayed on or near the center.

OK: There is a problem in X73-2120. Check the defective point by shorting each signal line.

NG: There is a problem in the T.SEP amp or R/O SW on X80-1370.

NG: There is a problem in V. FINAL.

j: TV synchronization is impossible.

Check the waveforms of the video amp on X74-1590.

OK: There is a problem in the Schmitt circuit.

NG: There is a problem in the circuitry before the video amp. Check the defective position following the signal flow. Be sure to check both TV-LINE and TV-FRAME.

k: The channels are not displayed properly.

Check the outputs from V-MODE LOGIC on X73-2120.

OK: There is a problem in the circuitry before the POSI amp of one of the channels. Check the waveforms.

NG: Check the V-CLK waveform.

OK: There is a problem in the V-MODE LOGIC.

NG: There is a problem in the H-MODE LOGIC on X74-1590.

l: ADD is not possible.

There is a problem in channel selector on X73-2120.

m: CHOP sweep is not possible.

Check the waveform at the collector of Q118 on X74-1590.

OK: There is a problem in the H-MODE LOGIC.

NG: There is problem in the CHOP generator.

n: Auto free-run is not possible.

Check +5V at pin 1 of IC106 on X74-1590.

OK: There is a problem in the A sweep gate.

NG: There is a problem in the free-run circuit.

o: Characters and STO waveform are not displayed on the CRT.

● Check the CURSOR MODE SW and R/O INTEN.

● Check the blanking signals at CN527-1, 2, 4 and 5 on the X79-1300.

OK: Check the signals at R/O X at CN527-7 and R/O Y at CN527-5.

If NG, go to the next check item. If OK, check V FINAL or H FINAL.

NG: There is a problem in the display control.

p: Character and STO waveform are not displayed properly on the CRT.

● Check if the CPU IC26 on X79-1300 is operates normally.

(Check the conditions of X3, 12 Mhz, IC26 data bus and

● Trace R/O X from the input to output to find if there is any abnormal position. Also check R/O Y from the input to output. (D/A circuit check)

OK: There is a problem in V FINAL or H FINAL.

NG: There is a problem in the display control of the D/A circuitry on X79-1300.

q: Character data is not displayed properly on the CRT.

● Trace the Panel control circuit on X79-1300 and its surroundings to find if there is any abnormal position.

OK: There is a problem in the Panel unit.

NG: There is a problem in the panel control.

r: The cursor and DTP do not function properly.

● Check if the cursor and DTP voltages are output properly.

			CHECK POINT
Δ	0V	4V	IC2-1
ΔREF	0V	4V	IC2-2
DTP	4V	0V	IC2-5

OK: There is a problem in the panel control D/A circuitry on X79-1300.

NG: There is a problem in the Panel unit.

s: The trace separation does not function properly.

● Check the operations of IC31, 32 and 36 on X79-1300.

OK: There is a problem in the sweep unit or final unit. Trace signals and identify the abnormal position.

NG: There is a problem in the panel unit or panel control.

t: Only the STO waveform is abnormal.

Check if the CPU and the surrounding circuitry are operating, then check the following points.

● Checking pin 29 (Vin) of IC100 (IC200) on X79-1300
OK: Go to the next check.

NG: There is a problem in the A/D preamp or the preamp unit.

● Checking pin 2 (CLK) of C100 (IC200) on X79-1300
OK: Go to the next check.

NG: There is a problem in the 80 MHz OSC or AD CLK OSC.

● Checking the clock signals output from IC45 on X79-1300
OK: There is a problem in one of the devices connected to IC45 or in the surroundings.

NG: There is a problem in IC45.

u: Abnormality occurs with other function than above.

Trace the signal path of the defective function referring to the block diagram to locate the defective position.

When all of the troubles have been repaired above, start readjustments following the adjustment procedures.

B	N09-0739-05	SCREW, SEMS BINDING TAPTITE (3 x 8)	
C	N14-0622-05	NUT, WITH TOOTH (M4)	
D	N19-0748-05	WASHER	
E	N30-3008-41	SCREW, PAN HD (M3 x 8)	
F	N30-4010-41	SCREW, PAN HD (M4 x 10)	
G	N32-3008-41	SCREW, FLAT HD (M3 x 8)	
H	N66-2612-41	SCREW, SEMS PAN HD (M2.6 x 12)	
J	N66-3006-41	SCREW, SEMS PAN HD (M3 x 6)	
K	N66-3008-41	SCREW, SEMS PAN HD (M3 x 8)	
L	N66-4012-41	SCREW, SEMS PAN HD (M4 x 12)	
M	N67-3008-41	SCREW, SEMS PAN HD (M3 x 8)	
N	N88-3006-41	SCREW, FLAT HD TAPTITE (3 x 6)	
P	N88-3008-41	SCREW, FLAT HD TAPTITE (3 x 8)	
Q	N89-3008-41	SCREW, BINDING TAPTITE (3 x 8)	
R	N89-3012-41	SCREW, BINDING TAPTITE (3 x 12)	

MODEL PC-33 (LOW CAPACITY PROBE)

ITEM	DESCRIPTION	PARTS NO.
①	Ground Wire Assembly	E30-1883-08
②	Retractable Hook Tip	E29-0540-08
③	Marker (Orange)	B42-1950-08

DISASSEMBLY

DCS-7020/7040

PARTS LIST

REF. NO	PARTS NO	NAME & DESCRIPTION
IC21	HD74LS157FP	IC, 2 TO 1 DATA SELECT./MPX
IC22	HD74LS157FP	IC, 2 TO 1 DATA SELECT./MPX
IC23	HD74LS157FP	IC, 2 TO 1 DATA SELECT./MPX
IC24	G2256BLFP7 SL	IC, SRAM 256K
IC25	G2256BLFP7 SL	IC, SRAM 256K
IC26	HD6433040A00F	IC, 16-BIT MICROPROCESSOR
IC27	HD74HC245FP	IC, OCTAL BUS TRANSCEIVERS
IC28	HD74LS244FP	IC, OCTAL 3-STATE BUS BUFFER
IC29	HD74HC244FP	IC, OCTAL BUS BUFFER
IC30	HD74LS244FP	IC, OCTAL 3-STATE BUS BUFFER
IC31	HD74LS374FP	IC, OCTAL 3-STATE D-FF
IC32	DAC0808LCM	IC, 8-BIT D/A CONVERTER
IC33	HA17012PB	IC, 12-BIT D/A CONVERTER
IC34	HA17012PB	IC, 12-BIT D/A CONVERTER
IC35	UPC814C	IC, JFET INPUT OP-AMP
IC36	NJM072BD	IC, JFET INPUT OP-AMP
IC37	SN74AS74NS	IC, DUAL D-F.F. (WITH PR & CLR)
IC38	SN74AS151NS	IC, 8 TO 1 DATA SELECTOR/MPX
IC39	HD74HC123FP	IC, DUAL MONOSTABLE MULTIB.
IC40	SN74AS153NS	IC, 4 TO 1 DATA SELECTOR/MPX
IC41	MB86001PF-GBND	IC, PLL FREQUENCY SYNTHESIZER
IC42	SN74F161ANS	IC, SYNC. 4-BIT BINARY COUNTER
IC43	SN74AS00NS	IC, 2-INPUT NAND GATE
IC44	SN74AS74NS	IC, DUAL D-F.F. (WITH PR & CLR)
IC45	CTM5300	IC, GATE ARRAY
IC46	HD74LS374FP	IC, OCTAL 3-STATE D-FF
IC47	HD74LS138FP	IC, 3-TO-8 DEMULTIPLEXER
IC100	AN8122FAP	IC, 8-BIT A/D CONVERTER
IC101	NO USE	
IC102	DTM6010	IC, GATE ARRAY
IC103	HM63021FF-34	IC, CMOS STATIC RAM

SWEEP UNIT (X74-1590-00)

This image shows a detailed view of a printed circuit board (PCB) layout. The board is populated with numerous electronic components, including integrated circuits, resistors, capacitors, and diodes, all meticulously labeled with alphanumeric codes. The layout features a dense network of copper traces and vias, with a grid system (A-K, 1-20) overlaid for component placement. The board is oriented horizontally, with the top edge showing a series of mounting holes and a label 'X74-1590-00'.
